I. PATCH DIMENSIONS AT A GIVEN RESONANCE FREQUENCY

A. Fringing Effects

Fringing fields at the lengths of the patch makes the patch appear to have a greater length than it actually does. This is important since the effective dimensions of the patch affect the resonant frequency. If the physical length of the patch is L , then the effective length, L_{eff} , can be written as

$$L_{\text{eff}} = L + \Delta L,$$

where ΔL is the additional length on one end of the patch.

The additional length can be related to the width of the patch, W and the effective relative permittivity of the dielectric substrate, ϵ_{eff} , as

$$\frac{\Delta L}{h} = 0.412 \frac{(\epsilon_{\text{eff}} + 0.3) \left(\frac{W}{h} + 0.264 \right)}{(\epsilon_{\text{eff}} - 0.258) \left(\frac{W}{h} + 0.8 \right)}. \quad (1)$$

B. Effective Relative Permittivity

To find the effective relative permittivity, we use [1]

$$\epsilon_{\text{eff}} = \frac{\epsilon_r + 1}{2} + \frac{\epsilon_r - 1}{2} \left(1 + 12 \cdot \frac{h}{W} \right)^{-1/2}. \quad (2)$$
